

FlipKart Customer Sentiment Analysis

The project involved collecting customer reviews for the Apple iPhone 15 (128GB) from Flipkart using Python and Selenium. The review data was cleaned by removing duplicates, handling missing values, converting text to lowercase, removing special characters, eliminating stopwords, and applying lemmatization. Additional features such as review length were created to support deeper analysis. Sentiment analysis was performed using TextBlob to classify reviews into Positive, Neutral, and Negative categories.
